Claims Intake Platform - Final Architecture

Customer: Harbor Mutual Insurance (fictional)

Policyholders submit claims through a web portal that is delivered from Amazon S3. The portal calls Amazon API Gateway, which invokes AWS Lambda functions. Claim records are stored in Amazon DynamoDB and supporting photos are stored in Amazon S3. Each new claim is published to Amazon SNS so that the adjuster notification service can send an email. Logs go to Amazon CloudWatch.

Flow: 1. Portal -> API Gateway 2. API Gateway -> Lambda
3. Lambda -> DynamoDB 4. Lambda -> SNS
